SUBJECT: Tall Cedars Parkway/Stone Springs Boulevard

Traffic Signal Threshold Study; Loudoun County, Virginia

INTRODUCTION

This document summarizes a traffic signal threshold study for the Tall Cedars Parkway/Stone Springs Boulevard intersection in Stone Ridge. The intent of the study was to identify the number of residential units that could be constructed and occupied prior to warrants for signalization being met at the intersection in conjunction with the revised proffer statement for the Stone Ridge Commercial development application.

The analyses conclude that approximately 2,530 residential units of the total approved 3,265 units could be occupied prior to exceeding level of service thresholds or meeting critical traffic signal warrants at the Tall Cedars Parkway/Stone Springs Boulevard intersection, as outlined below.

BACKGROUND DATA AND TRAFFIC FORECASTS

This constraint study is based on the Stone Ridge Commercial Revised Traffic Impact Study, prepared by Wells + Associates, Inc. dated June 16, 2009. The traffic forecasts developed through the preparation of this study were used as a baseline condition for this constraint analysis. The future traffic volume forecasts assumed a horizon year of 2015, and full buildout and occupancy of all the commercial space within the site.

Iterative traffic forecasts for the Tall Cedars Parkway/Stone Springs Boulevard intersection were prepared with various levels of residential development. These volumes were then analyzed from a level of service perspective (as an all-way stop condition) and the resulting Average Daily Traffic (ADT) was used to evaluate the traffic signal warrants. A copy of the traffic volume forecasts, lane use, and levels of service are shown on Figure 1.

LEVELS OF SERVICE AND SIGNAL WARRANT ANALYSIS

The peak hour and daily traffic forecasts were analyzed to determine the level of service and anticipated traffic signal warrants at the Tall Cedars Parkway/Stone Springs Boulevard intersection. The intersection operates as an all-way stop condition and is expected to continue to operate in this manner in the future.

The traffic forecasts that include all of the commercial space and 2,530 residential units were analyzed with the results and are contained in the Appendix. All of the intersection approaches are expected to operate at acceptable levels of service (LOS) "D" or better during both the AM and PM peak periods.

The average daily traffic volumes were evaluated in accordance with Virginia Department of Transportation standards with the results contained in the Appendix. The results indicate that only Warrant IA (Minimum Vehicular Volume) would be met under future conditions assuming all of the commercial space and up to 2,530 residential units of the 3,265 units is built and occupied. Satisfaction of this warrant only does not generally constitute the need for a traffic signal.

CONCLUSION

The results of the threshold analysis conclude that in addition to buildout of the commercial development space, approximately 2,530 residential units of the total approved 3,265 units could be built and occupied while allowing for adequate levels of service and prior to meeting critical traffic signal warrants at the Tall Cedars Parkway/Stone Springs Boulevard intersection. Thus, the revised proffer statement that includes this threshold is adequate.

Questions regarding this document should be directed to Wells + Associates.
